kart

The trust layer for AI agents that spend money.

Any AI agent can shop through Kart. Your rules decide what gets paid, PayPal moves the money, and you're paid back first if anything goes wrong.

Built with PayPal Channel3 AG Grid Claude Render

github.com/Naveed-CoLab/Kart-App

The problem: agents can shop, but people won't let them pay.

AI agents can already search, compare and check out. The missing piece is trust.

52%
of shoppers aren't comfortable letting an AI agent buy for them

42%
say their top fear is losing control of what gets bought

30%
would change their mind with easy refunds

28%
would change their mind with spending limits

No limits
An agent can buy nothing, or anything. Nothing in between.

No way back
Agent checkout stops at "paid". A wrong or damaged item is your problem.

No shared control
Every agent needs its own payment setup, and nobody sees what they all did.

Kart answers exactly these fears: limits before the purchase, PayPal during it, and a refund-first guarantee after it, for every agent at once.

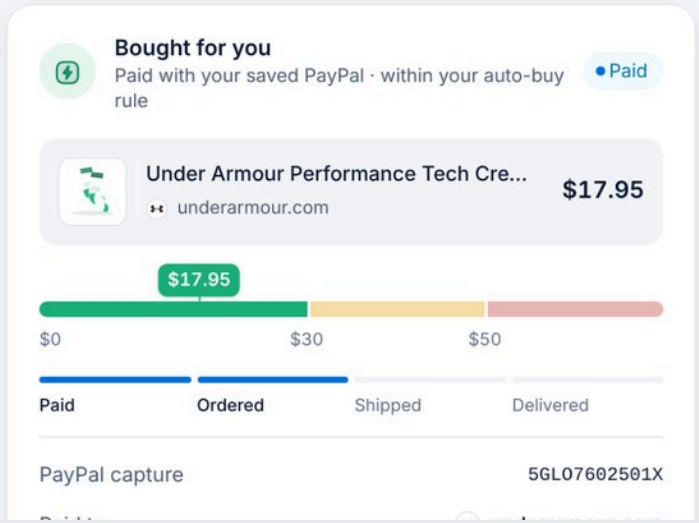

Source: Checkout.com consumer survey on agentic commerce, December 2025

The solution: one set of rules, three outcomes.

The same request ends one of three ways, decided by Kart's server code and never by the AI's prompt.

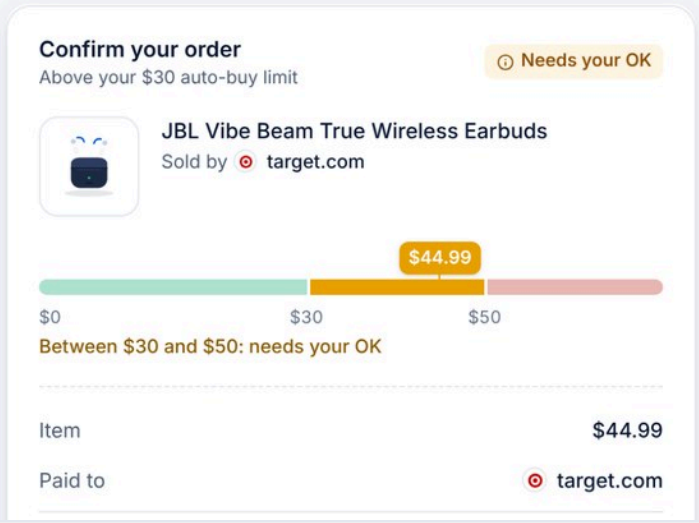

$17.95 socks: bought

Under the $30 auto-buy limit, so Kart pays with saved PayPal.

$44.99 earbuds: waits for you

Between $30 and $50, so the shopper confirms first.

$89.95 shoes: blocked

Over the $50 max per item, so no money moves.

Before the purchase

Your rules

Auto-buy limit, max per item, monthly cap, and a smaller budget for each agent.

During the purchase

PayPal

Pays the store. Agents never see PayPal details or cards.

After the purchase

The Kart Guarantee

Damaged, lost or cheaper later: paid back first, then Kart settles with the store.

Cards from the app, shown with sample orders and illustrated product pictures

How it works: from a sentence to a paid, protected order.

1

Ask

"Buy me running socks under $20", in Kart's chat or any MCP agent.

- Claude
- MCP

2

Find

Every store selling the exact product; pick the cheapest in stock.

- Channel3

3

Check

Live price re-check, your limits, this agent's budget.

- Kart rules
- Channel3

4

Pay

Saved PayPal pays on its own, or you tap Confirm & pay.

- PayPal Vault
- Orders

5

Ship

The store ships; tracking lands on the PayPal transaction.

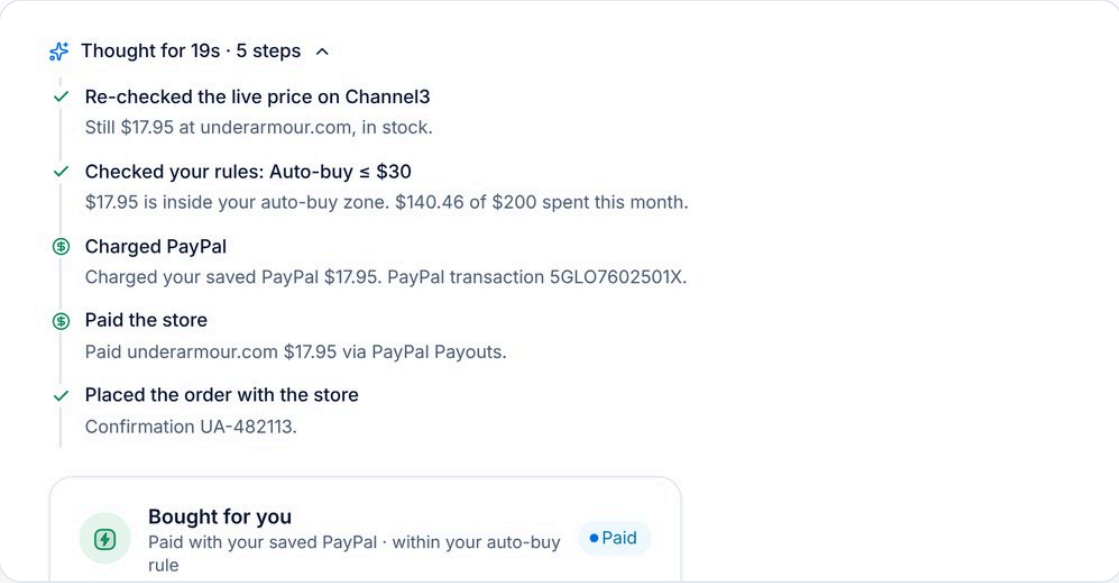

- PayPal Agent Toolkit

6

Protect

Photo claim checked by AI, money back first.

- Claude vision
- Payouts
- Refunds

Every step is visible, and every step is real.

- The live trace in the chat is built from events Kart actually logged: the search, the price re-check, the rule that decided, the PayPal charge and the store payment.
- A purchase needs a signed, single-use, 10-minute confirmation bound to the product and exact price. The AI has no tool that can create one.
- If the live price went up since the shopper saw it, Kart refuses to charge.
- The same record feeds the decision trail and the Insights dashboard.

Screenshot: the live trace and order card for a $17.95 auto-buy

Each tool does the job it is best at.

No card data, no custom payment code, no scraped prices. Kart is the rules layer that connects them.

Tool	In use	What it does in Kart	Why it matters
PayPal	**7** capabilities	Orders v2 and JS SDK (checkout in chat, Pay Later), Vault (one-tap and auto-buy), Payouts and Refunds (the Guarantee), Partner Referrals (stores), Agent Toolkit (tracking), signed webhooks.	PayPal is the whole money layer: pay, save, pay back, onboard, track.
Claude Anthropic	**3** roles	Shopping agent with tool use, vision check on damage photos, and the dashboard assistant. Kart is also an MCP server with 5 tools for outside agents.	AI does the judgement. It can never move money on its own.
Channel3	**3** endpoints	Agentic search, every store's offer for the same product, a live re-check before each payment, and search by photo.	Agents stop overpaying: cheapest store, never a stale price.
AG Grid	**2** pages + AI	AG Studio dashboard: spend, savings, blocks and every PayPal transaction; a custom guardrail widget; Ask Kart AI on the Studio Agent Framework, running on Claude.	Oversight: see and question what every agent did with your money.
Render	**1** service	Hosts the live demo from a single `render.yaml`, with Neon Postgres for storage.	Judges can try the real thing in a browser.

All payments run in the PayPal sandbox. Logos and brand colours belong to their owners.

What Kart solves that agent checkout leaves open.

	Agent checkout today	Kart
Spending limits	In the prompt, if at all	✓ **Enforced in server code, outside the AI**
Which agents	One vendor's own agent	✓ **Any MCP agent, one set of rules**
Control per agent	All or nothing	✓ **Own budget, expiring key, pay-on-its-own off by default**
Price at payment	Whatever the search returned	✓ **Cheapest store, re-checked live before charging**
After checkout	Dispute form	✓ **Paid back first through PayPal**
Record	Chat history	✓ **Live trace, decision trail, Insights dashboard**

3
outcomes for every request: bought, asks you, blocked

7
PayPal capabilities working together

5
MCP tools any agent can call

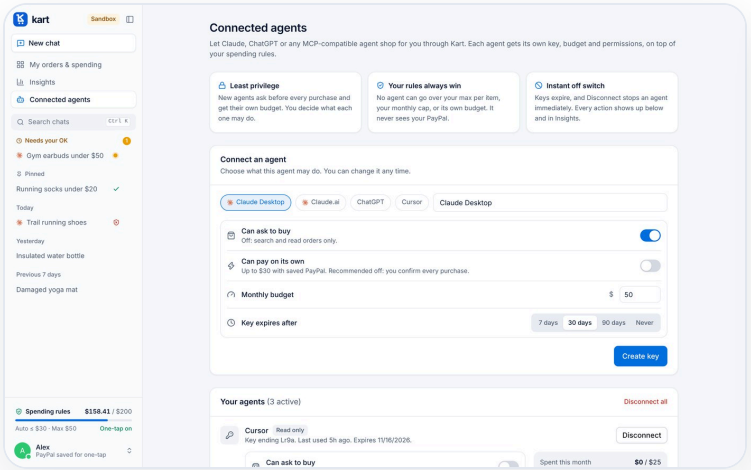

2
price checks: at search and right before paying

10 min
free undo on every saved-PayPal order

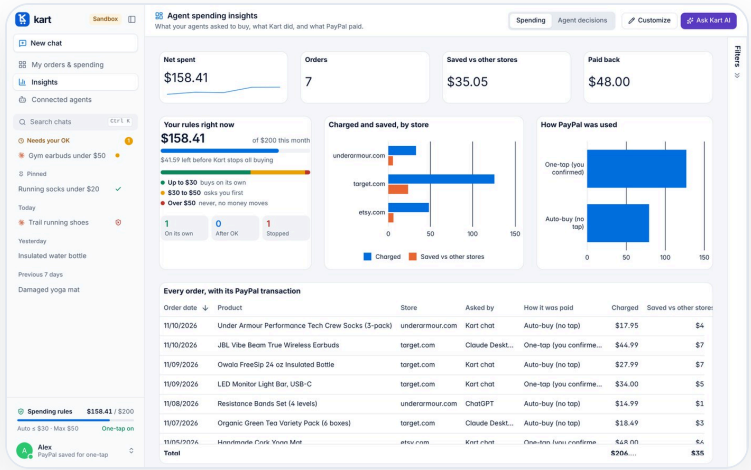

$0
moves when a rule says no

"Agent checkout today" describes common agent shopping flows, not a specific product

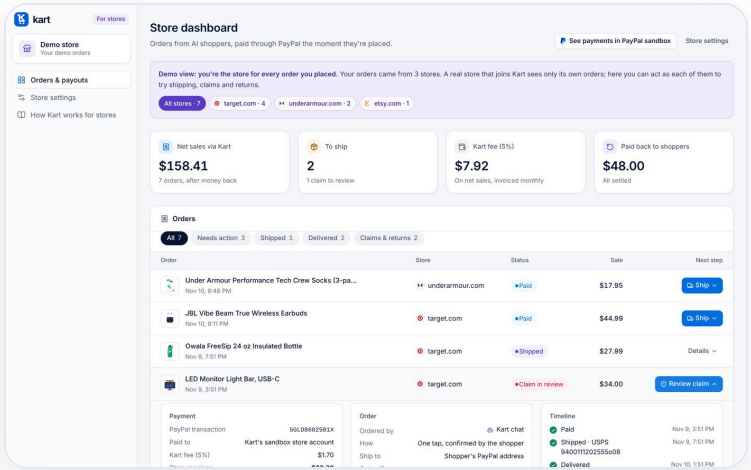

A complete product for shoppers, agents and stores.

Connected agents. Claude Desktop, ChatGPT or Cursor shop through Kart, each with its own key, budget and expiry.

Insights (AG Studio). What agents bought, what Kart blocked, what you saved, and an AI you can ask.

Store dashboard. Orders arrive already paid. Ship with tracking, settle claims, see fees.

Code (MIT)
github.com/Naveed-CoLab/Kart-App

Scope today
Stores are paid through PayPal in the sandbox; the order on the store's own site is simulated until checkout APIs open up.
